2. The Analyst — George Berkeley

- A sharp philosophical attack on calculus.
- Calls infinitesimals: "ghosts of departed quantities"

→ This is one of the most important critiques in history. It forced mathematicians to confront: $\boxed{\text{What exactly are we doing when we take limits?}}$

3. A History of Analysis — Hans Niels Jahnke (Editor)

- Tracks the transition from intuition → rigor.
- Covers: 1) Augustin-Louis Cauchy 2) Bernard Bolzano 3) Karl Weierstrass

→ Shows how: 1) limits replaced infinitesimals 2) ε-δ definitions emerged.

4. Journey Through Genius — William Dunham
